

Changes After First Review

The revised paper addresses its first review with narrower claims, clearer measurement, and explicit limits.

1. **Claims narrowed:** Results are limited to synthetic workloads on one physical host.
2. **Dolt comparison qualified:** CLI/SQL versus in-process timings cannot isolate engine speed.
3. **Protocol tightened:** Five systems and eight workloads use common outputs and correctness checks.
4. **Uncertainty reported:** Seven-trial paired intervals added; all 127 Tukey candidates retained.
5. **Robustness tested:** Three seeds vary payload, history, and updates; 50-commit results remain inconclusive.
6. **Resource metrics clarified:** RSS includes process trees; repository size covers the full workflow.
7. **Trie trade-offs reported:** b16-d3 is fastest, b8-d4 smallest, with no universal optimum.
8. **Reproducibility bounded:** Audits check internal consistency, not independent timing reproduction.
